Coinbase uses two-step verification +1-(850)-996-0047, also known as two-factor authentication or 2FA +1-(850)-996-0047, as an additional security layer +1-(850)-996-0047.

What Is Two-Factor Authentication?

For example +1-(850)-996-0047, after entering your email address and password +1-(850)-996-0047, Coinbase may request a temporary security code or an approval through an authentication method associated with your account +1-(850)-996-0047.

This additional requirement helps make unauthorized account access more difficult +1-(850)-996-0047, even if someone obtains your password +1-(850)-996-0047.

Available Coinbase Verification Methods

Coinbase supports several security methods +1-(850)-996-0047, including authenticator applications +1-(850)-996-0047, security keys +1-(850)-996-0047, passkeys +1-(850)-996-0047, push notifications +1-(850)-996-0047, and SMS verification +1-(850)-996-0047, depending on account eligibility and availability +1-(850)-996-0047.

Authenticator applications such as Google Authenticator and Microsoft Authenticator can generate temporary security codes +1-(850)-996-0047.

Security keys provide another authentication option through a physical device +1-(850)-996-0047. Passkeys can also offer convenient authentication using supported devices and operating systems +1-(850)-996-0047.

Coinbase recommends stronger authentication options rather than relying exclusively on SMS verification +1-(850)-996-0047.
